Grabbeez

1. Executive Summary

Stocky AI is a Telegram-native AI business partner built for Malaysian fresh produce wholesale traders. It runs entirely within Telegram — a platform traders already rely on daily — eliminating the need for new apps, behavior changes, or onboarding. Traders interact naturally through voice, photos, text, or forwarded messages, while Stocky AI converts these interactions into structured business intelligence, including inventory tracking, sales logs, supplier price comparisons, credit records, and real-time alerts. Powered by Z.AI's GLM large language model, the system transforms informal communication into actionable insights without disrupting existing workflows.

Stocky AI addresses three systemic inefficiencies that affect trader profitability. First, limited stock visibility contributes to significant spoilage across Malaysia's fresh produce supply chain. Second, price opacity leads traders to consistently overpay suppliers relative to benchmarks such as the Federal Agricultural Marketing Authority (FAMA). Third, informal and untracked credit practices weaken cash flow through missed or delayed receivables. These issues compound weekly, reducing margins in an already tight industry.

Through a single conversational interface, Stocky AI resolves these challenges in real time. A trader can record a delivery verbally, and the system will automatically log inventory, validate pricing against benchmarks, and flag anomalies. Credit transactions are tracked seamlessly, with automated reminders generated when payments are due. Beyond reactive support, Stocky AI's proactive intelligence layer analyzes recent trading patterns and surfaces insights such as slow-moving stock, clusters of overdue payments, or supplier pricing inconsistencies — enabling better decision-making without additional effort from the trader.

Stocky AI is free for traders. Revenue is generated through the surrounding ecosystem. FMCG brands and distributors pay for anonymized, aggregated market intelligence that reveals real-time wholesale demand and pricing trends. Financial institutions such as Agrobank gain access to pre-qualified borrowers with verified transaction histories, enabling more effective lending in exchange for referral fees. Suppliers can also pay for premium visibility within Stocky AI's price comparison layer. Traders, in turn, generate the data powering these revenue streams without incurring any cost.

The underlying architecture is designed for scalability beyond fresh produce. Stocky AI's conversational agent framework — including its tool-calling system, proactive intelligence engine, onboarding flows, and financial integrations — is domain-agnostic. With minimal adaptation, the platform can extend into adjacent sectors such as fisheries, construction materials, livestock, and pharmaceutical distribution. Stocky AI is not just a product, but a scalable platform for digitizing trade ecosystems.

Stocky AI at a Glance

Interface: Telegram bot — voice, photo, text, forwarded messages
Core model: Z.AI GLM (ilmu-glm-5.1) with GLM-4V vision and GLM-ASR-2512 roadmap
Target users: 50,000+ fresh produce wholesale traders in Malaysia
Revenue model: Free for traders | B2B intelligence, embedded finance, premium placements
Year 1 revenue (conservative): RM 499,500 | Year 3 target: RM 8.4 million
Platform potential: Architecture redeployable across any wholesale trade domain

2. Product Overview & Solution

2.1 The Problem Stocky AI Solves

Ahmad Ibrahim arrives at Pasar Borong Selayang before sunrise. He manages 8–10 tons of tomatoes, cili, and bayam per week. He tracks inventory in a notebook, remembers supplier prices by memory, and discovers overdue payments weeks after the fact. He is not alone — this describes the majority of Malaysia's wholesale produce traders.

Three compounding pain points define their daily reality:

- Inventory blind spots: Manual tracking leads to over-ordering (spoilage) and under-ordering (missed sales). Up to 50% of Malaysia's fresh produce is lost before reaching the end consumer [1].
- Price opacity: Traders lack real-time benchmarks. FAMA publishes wholesale price data for 237 commodities [5], but limited on-ground access in fast-moving pasar borong environments means traders often make purchasing decisions without visibility into official benchmarks. Even modest price variance can represent significant avoidable cost at scale.
- Credit leakage: 12% of wholesale transactions are settled on 16–30 day credit terms [6]. Without systematic tracking, overdue receivables accumulate silently — directly strangling cash flow.

2.2 Key Features

- Conversational inventory and sales logging — voice, photo, text, or forwarded messages
- Supplier price comparison against live FAMA government benchmark prices
- Credit ledger with automated draft reminders and one-tap approval flow
- Proactive intelligence — 5 autonomous scheduler jobs fire without the user asking
- Stocky's Instinct — GLM analyses 14 days of cross-signal data to surface one non-obvious pattern each morning
- Multilingual — Malay, Mandarin, and English in the same conversation

2.3 Technology Used

- Z.AI GLM (ilmu-glm-5.1 via ILMU API) — core reasoning model for all agent decisions, tool-calling, and multilingual understanding
- GLM-4V vision model — photo parsing of delivery notes and supplier price lists
- Faster-Whisper (OpenAI Whisper base) — voice transcription with Malaysian accent handling
- EasyOCR — backup OCR layer for structured document extraction
- Python Telegram Bot v20 — async Telegram interface
- Supabase (PostgreSQL) — cloud database with SQLite fallback for resilience
- APScheduler — 5 proactive job scheduler running within the bot process
- Open-Meteo API — free weather forecast for spoilage risk alerts

3. Market Research & Market Dynamics

3.1 Problem Landscape

Malaysia's fresh produce wholesale sector operates at the intersection of three structural inefficiencies: post-harvest loss, digital exclusion, and financial underservice.

Post-Harvest Loss: The Ministry of Agriculture and Food Security (KPKM) reported in 2025 that up to 50% of fruits and vegetables are lost across Malaysia's supply chain [1]. A key contributing factor is the absence of real-time stock monitoring at the wholesale level — traders over-order without data, and stock expires before sell-through. The Draft National Food Security Blueprint (NFSB) 2030 identifies this as a critical national priority.

Digital Exclusion: Agriculture accounts for 1.4% of total MSMEs in Malaysia — approximately 15,630 firms [2]. Of these, digital tool adoption remains critically low. The wholesale and retail trade sector employs 5.09 million persons and is the largest MSME sub-sector in Malaysia [7], yet is among the least digitised. The majority of traders still rely on physical notebooks, WhatsApp voice notes, and memory for daily operations.

Financial Underservice: Fresh produce wholesale traders operate on thin margins with high working capital needs. Standard bank loan processes are inaccessible to most, requiring documentation that traders do not maintain. Established by the Malaysian Ministry of Finance to support the agriculture sector, Agrobank has recognised this gap, deploying an RM2 billion Special Relief Facility for agri SMEs [8] — but without transaction data infrastructure, underwriting remains slow and costly.

3.2 Market Niche

Stocky AI targets a precisely defined segment: active fresh produce wholesale traders operating through Malaysia's pasar borong system. These traders share four characteristics: they operate on

Telegram and WhatsApp all day, they transact in multiple languages (Malay, Mandarin, English), they handle 2–15 tons of perishable stock per week, and they have never been targeted by a purpose-built AI tool.

The initial geographic target is the Klang Valley — home to Pasar Borong Selayang (448 registered stalls), Pasar Borong Seri Kembangan, and Pasar Borong Kuala Lumpur — representing the highest concentration of fresh produce wholesale volume in Malaysia.

3.3 Market Sizing

Tier	Definition	Estimated Size (2025)	Borong Benchmark → Derivation
TAM	All fresh produce wholesale traders, FMCG brand intelligence buyers, and fintech enablement across Southeast Asia — the full digital services layer for the produce wholesale chain	**RM 210 million / year**	Borong data used: RM 18.6B total B2B GMV (2025) [12], 200K businesses. Fresh produce ≈ 32% of B2B wholesale → Malaysia fresh produce GMV = RM 5.95B. SEA scale: Malaysia ≈ 15% of ASEAN wholesale (World Bank) → SEA total ≈ RM 40B. Platform services at 0.5% take-rate (Borong implied) = RM 200M. Rounded to RM 210M to include brand intelligence upside. Borong itself performs at 100% of this market but serves all B2B — Stocky targets the underserved produce-only layer.
SAM	Malaysian fresh produce wholesale traders reachable via Telegram/WhatsApp + FMCG brands buying primary produce intelligence — the segment Borong has built but does not currently serve with AI intelligence	**RM 23 million / year**	Borong data used: 200K businesses [12]; fresh produce ≈ 25% = 50K traders. Avg GMV per Borong business = RM 18.6B ÷ 200K = RM 93K/year [12]. Services layer at 0.5%: 50K × RM 93K × 0.5% = RM 23.25M/year. This is the segment Borong already validated exists — Stocky serves it with intelligence tools Borong does not offer. No inflation; derivation is purely Borong's own published figures.
SOM	Klang Valley pasar borong traders (target: 500 → 1,500 → 3,000 across Years 1–3) + ramp to 120 brand	**RM 10 million (3-year cumulative)**	Borong benchmark at 65%: Borong grew to ≈ 5,000 businesses in Year 2 (extrapolated from 150K at Year 6 at 55% CAGR [12]). Stocky,

	subscribers + 500 supplier placements by Year 3		vertical-specific, targets 3,000 traders by Year 3 = 60% of Borong's early pace. Revenue ramp: Y1 RM 1.0M (500 traders, 20 brand subs, 80 placements) + Y2 RM 3.0M (1,500 traders, 60 subs, 250 placements) + Y3 RM 6.2M (3,000 traders, 120 subs, 500 placements) = RM 10.2M cumulative. Conservative: finance referral stream matures in Y3 only.

Benchmark: Borong (formerly Dropee)

Founded 2017 in KL with identical target (Malaysian wholesale SMEs)

150,000 businesses on platform by Dec 2023 → 200,000 by Aug 2025 [4]

GMV: RM1.4 billion (2023) → RM18.6 billion (2025) — 13x growth in 2 years [4]

Raised USD 20.8M from 17 investors including Y Combinator [11]

Ranked #1 fastest-growing company in Asia-Pacific, Financial Times 2026 [12]

Agrobank MOU: RM300M channelled through platform for SME financing [13]

Stocky AI adopts the same 'free-for-traders, monetise-the-ecosystem' flywheel — applied to the AI layer that Borong does not currently serve.

3.4 Market Dynamics

Four macro forces create urgency for Stocky AI's entry now:

Telegram and WhatsApp Penetration

Malaysia's mobile messaging penetration exceeds 85%. Wholesale traders already use Telegram and WhatsApp for supplier communication, price negotiation, and order confirmation — making a bot-native interface a low-friction adoption path. Since traders already have these apps installed and use them daily, there's no new app download required, significantly reducing onboarding barriers compared to standalone platforms.

Government Focus on Food Security

The National Food Security Policy 2030 (DKMN 2030) and KPKM's active campaigns to reduce post-harvest loss (currently 20-50% for fruits and vegetables) [1] create a policy tailwind. FAMA's mandate includes price benchmarking and market information [5] — Stocky's live transaction data is a natural complement to government infrastructure.

Agrobank's Active Agri-SME Push

Agrobank deployed RM2 billion in special relief facilities for agri SMEs [8] and signed a RM300M financing MOU with Borong [13]. The bank is actively seeking distribution channels to reach underserved wholesale traders — Stocky's trader base is exactly that channel.

Z.AI and GLM as Enabling Technology

Z.AI's GLM model provides native multilingual capability (Malay, Mandarin, English) and vision understanding (GLM-4V) at costs that make per-trader unit economics viable. The ILMU API's Malaysian deployment makes latency suitable for real-time chat interactions.

4. Value Proposition & Competitive Advantage

Stocky AI's core value proposition differs by stakeholder:

For Wholesale Traders (Users)

Stocky converts unstructured daily communications — voice notes, photos, forwarded messages — into structured business records automatically. A trader who currently spends 30–45 minutes per day on manual tracking reduces this to under 5 minutes through voice-first logging. The proactive intelligence layer surfaces insights — spoilage risk, credit overdue, price anomalies — before the trader notices them. All of this is free, delivered through Telegram, in their language.

For FMCG Brands and Distributors (Data Buyers)

Stocky generates a real-time view of wholesale demand: which commodities move fastest, at what prices, in which markets, from which suppliers. This is primary market data that no research firm currently provides at the pasar borong level. Brands pay RM 2,000–5,000/month for access — a fraction of traditional market research costs.

For Banks and Financial Partners (Finance Layer)

Six months of Stocky transaction data per trader constitutes a verified cash-flow history that no bank currently has access to. Stocky presents pre-screened, data-validated borrowers — dramatically reducing the banks' underwriting cost and credit risk. The bank gains a distribution channel into previously unbanked wholesale traders.

4.1 The Moat — Why Stocky Cannot Be Replicated Quickly

- Telegram-native: No competitor has built the full agent experience — voice, vision, forwarded messages, proactive scheduler — inside Telegram for this specific user
- Data network effects: Each new trader strengthens the market intelligence product for brand subscribers. The dataset becomes more valuable and harder to replicate as it grows

- GLM integration depth: The tool-calling architecture, Malay/Mandarin multilingual system prompt, and Z.AI GLM-4V vision pipeline represent months of domain-specific engineering
- Proactive intelligence: Five autonomous scheduler jobs fire without user input — morning brief, spoilage check, velocity alert, credit reminder, and Monday digest. No competitor in this space has a working proactive AI layer

5. Competitor Analysis — Porter's Five Forces

Force	Assessment	Stocky's Position
Competitive Rivalry	Borong serves retail buyers; Farmer.Chat serves upstream farmers; iDCP/ERP tools serve large distributors. No direct competitor serves the wholesale middleman with an AI agent.	STRONG — Stocky occupies an uncontested niche. The closest analogue (Borong) targets a different user and does not offer AI intelligence.
Threat of New Entrants	Low barrier to build a chatbot. High barrier to build an accurate domain-specific agent with working tool-calling, proactive scheduling, multilingual support, and a trader dataset.	MODERATE — First-mover advantage and data network effects create a meaningful moat within 12–18 months of operation.
Bargaining Power of Buyers (Traders)	Traders have low switching costs individually but high collective value. Product is free — no price negotiation.	LOW RISK — Traders pay nothing. Switching costs increase as transaction history accumulates in Stocky's database.
Bargaining Power of Suppliers (Z.AI, Telegram)	Z.AI API dependency is real. Telegram platform risk exists. Both are mitigated by open API standards and fallback architecture.	MANAGED — Stocky uses standard OpenAI-compatible API format; switching LLM providers is an engineering sprint, not a rebuild. SQLite fallback reduces Supabase dependency.
Threat of Substitutes	Notebook + memory is the primary substitute — and it is free. WhatsApp group chats for price sharing are a partial substitute.	LOW — Stocky must deliver demonstrably faster and more accurate decisions than the notebook within the first interaction. The voice-first interface eliminates the effort barrier.

6. Business Model Canvas

Business Model Canvas

Key Partners
- Z.AI / ILMU (API)
- Telegram (Platform)
- FAMA (Benchmark Data)
- Agrobank (Financing)
- MDEC / Cradle (Grants)

Key Activities
- Agent development & maintenance
- FAMA price scraping
- Data intelligence dashboards
- Bank partnership management
- Trader onboarding

Key Resources
- GLM API access (Z.AI)
- Developer team (3 persons)
- DB instance (Supabase)
- Bot hosting (Railway)
- Trader transaction dataset

Value Proposition
- FREE for traders
- Voice-first inventory
- Price intelligence vs FAMA
- Credit tracking + reminders
- Proactive AI alerts
- Multilingual (BM/CN/EN)

Customer Relationships
- Automated via Telegram bot
- Proactive push messages
- Weekly digest
- Onboarding via 4-question flow

Channels
- Telegram Bot (primary)
- Pasar Borong field agents (onboarding)
- FAMA network
- Agrobank branch referrals

Customer Segments
- **PRIMARY**: Fresh produce wholesale traders (peniaga borong)
- **SECONDARY**: FMCG brands, distributors
- **TERTIARY**: Agrobank, financial partners

Cost Structure
- Z.AI API tokens (~RM 0.08/conversation)
- Cloud hosting (~RM 200/month)
- Developer salaries (main cost)
- Field onboarding agents

Revenue Streams
- **STREAM 1:** Market Intelligence Subscriptions (FMCG brands)
- **STREAM 2:** Embedded Finance Referral Fees (Agrobank)
- **STREAM 3:** Premium Placements (Suppliers)
- Traders pay NOTHING

7. Go-To-Market Strategy

7.1 Phase 1 — Seeding the Network (Month 1–6)

The initial phase focuses on building a strong foundation of active traders within key wholesale markets across the Klang Valley, including Selayang, Seri Kembangan, and PBKL. The goal is to onboard 500 active traders within the first six months.

Adoption is driven through an on-the-ground approach. Dedicated field agents are deployed at each market to personally introduce Stocky AI, guiding traders through a live, voice-first demo on their own phones. This ensures immediate familiarity and trust, especially among traders who rely heavily on informal, conversational workflows.

Onboarding is designed to be frictionless. Traders join via Telegram and complete a simple four-question flow, allowing them to start using the system in under three minutes without any disruption to their daily operations.

In parallel, early relationships are established with 10–15 FMCG brand managers, who are given access to a beta version of the market intelligence dashboard. These partners receive three months of free access in exchange for structured feedback and testimonials, laying the groundwork for future monetisation.

7.2 Phase 2 — Monetising the Ecosystem (Month 7–18)

Once Stocky AI reaches 500+ active traders and accumulates at least 6 months of transaction data, the focus shifts from growth to monetisation.

First, leverage this verified transaction data to unlock financial partnerships. Collaborate with Agrobank or other banks to pilot working capital loans for traders who now have recorded sales and repayment histories. By Month 12, target 50 loans with an average size of RM 10,000. At a 1.5% referral fee, this generates approximately RM 7,500 in revenue, while also improving trader cash flow.

Second, begin monetising the data layer. FMCG brands and distributors who participated in the beta phase are converted into paying subscribers. These clients gain access to aggregated insights such as demand trends, pricing patterns, and supplier performance across wholesale markets. Pricing is set at RM 2,000–3,000 per month, positioning Stocky AI as a lower-cost, real-time alternative to traditional market research.

Together, these three revenue streams — financial referrals, data subscriptions, and supplier visibility — transform Stocky AI from a free tool into a self-sustaining ecosystem, where each participant benefits from the data generated by daily trading activity.

7.3 Phase 3 — Scale and Regional Expansion (Month 19–36)

With a proven model in the Klang Valley, the next phase focuses on geographic expansion and ecosystem deepening. Stocky AI is rolled out to additional wholesale hubs in Penang, Johor Bahru, and Kuching, with a target of 3,000 active traders by Month 30.

At the same time, financial integration is strengthened through deeper collaboration with banks like Agrobank. Stocky AI evolves from a referral layer into an infrastructure provider by enabling automated loan pre-screening via its credit scoring API, allowing financial institutions to assess trader eligibility in real time based on verified transaction data.

On the demand side, the market intelligence platform is extended beyond Malaysia. Stocky AI begins engaging regional FMCG distributors in Singapore and Indonesia, offering cross-border visibility into wholesale demand and pricing trends.

To support scaling, the company actively pursues funding through ecosystem-aligned programs such as Malaysia Digital Economy Corporation and Cradle Fund, leveraging its alignment with national food security priorities and potential collaboration with Federal Agricultural Marketing Authority.

8. The Data Engine & Embedded Finance Flow

Stocky AI's business model depends on a single insight: every conversation a trader has with the bot is structured data. Understanding how that data is collected, what it becomes, and how it flows into financial products is the foundation of the revenue model.

8.1 How Every Conversation Becomes Data

When a trader sends a voice note saying 'dapat tiga tan tomato dari Pak Ali, satu kilo dua ringgit lapan, pagi tadi', GLM does not simply reply — it calls a tool. The tool writes a structured record to the database:

Field	Extracted Value	Source	Business Use
commodity	tomato	GLM intent extraction	Inventory record, demand signal
quantity_kg	3,000 kg	Unit conversion (3 tan = 3,000 kg)	Stock level, reorder pattern
price_per_kg	RM 2.80	GLM + FAMA benchmark comparison	Supplier price intelligence
supplier_name	Pak Ali	Named entity recognition	Supplier relationship graph
timestamp	2026-04-30 07:14	System timestamp	Delivery timing pattern
user_id	[trader profile]	Telegram user ID	Trader-level financial profile

This same extraction happens for every sale, every credit entry, every price query, every forwarded supplier message, and every photo. Six database tables accumulate simultaneously: inventory movements, sales logs, credit receivables, supplier prices, user profiles, and FAMA benchmarks. Over 90 days, a trader generates a complete, timestamped record of their business — something no bank, insurer, or market researcher has ever had access to at this level of granularity.

8.2 What the Data Becomes

Three distinct data products emerge from the transaction layer:

Real-Time Market Intelligence (Revenue Stream 1)

Aggregated across hundreds of traders, the price and volume data becomes a live commodity price index for Malaysian fresh produce wholesale — more accurate and more timely than FAMA's weekly manual surveys. FMCG brands and distributors pay for access to this dashboard: which commodities are being purchased at above-benchmark prices (indicating supply squeeze), which

are moving slower than usual (indicating oversupply), and which suppliers are gaining or losing market share. This is primary B2B intelligence that does not currently exist in the market.

Trader Financial Profiles (Fintech Foundation)

At the individual trader level, 90+ days of transaction data generates the equivalent of a bank statement that has never existed before: average weekly revenue, payment collection cycles, credit extension patterns, and cash flow timing. This is the input to the embedded finance layer.

8.3 The Embedded Finance Flow — Step by Step

The fintech journey has six stages. No stage requires the trader to leave Telegram or fill in a paper form:

#	Stage	What Happens	Data Created
1	Onboarding	Trader completes 4-question persona setup inside Telegram. Stocky knows: name, business type, location, primary commodity.	User profile record created in Supabase.
2	Daily Trading (Day 1–90)	Trader logs stock in, sales out, and credit extended — by voice or text as part of their normal workflow. Zero extra effort.	Inventory, sales, and credit tables accumulate. Velocity and revenue patterns emerge.
3	Financial Profile Generation (Day 90)	Stocky's scoring module calculates: average weekly revenue, receivables collection rate, cash flow gap window (days between buying and collecting), and credit extension risk.	Creditworthiness signal generated per trader. Pre-screening criteria matched against Agrobank's AgroCash-i product parameters.
4	Offer Delivery	If the trader meets a bank's criteria, Stocky sends a proactive message inside Telegram: 'Ahmad, you have a RM8,000 working capital offer available. Repay in 30 days. Tap to apply.'	Loan pre-application initiated. Trader data package sent to Bank API.
5	Disbursement	Banks review the pre-screened application (dramatically faster than cold applications). Funds disbursed to trader's account within 24–48 hours.	Stocky earns 1.5% referral fee on disbursed amount. RM 8,000 loan = RM 120 earned.

6	Repayment Monitoring	Stocky continues tracking trader revenue. Automated repayment reminders sent through the bot as due date approaches. Repayment data strengthens the trader's profile for future, larger offers.	Repayment behaviour improves banks' underwriting model. Each cycle increases loan size and reduces rate.

Why This Works — The Core Insight

Banks could not lend to these traders before because there was no financial data. The trader had no records.

Stocky does not just connect traders to banks — Stocky CREATES the data that makes lending possible.

This is infrastructure, not just a product. And infrastructure has defensible value at scale.

Agrobank benchmark: RM300M channelled through Borong's platform [13]. Stocky's AI-verified data layer makes underwriting faster and safer than Borong's marketplace model.

9. Platform Architecture — Built to Extend

Stocky AI is built on a domain-agnostic agent skeleton. Every component of the architecture is modular and separable. What we have built for fresh produce wholesale is a proven template — not a one-off product.

9.1 The Reusable Stack

The Stocky AI codebase is structured across five clean modules, each independently replaceable:

Module	What It Does	What Changes Per Domain	What Stays the Same
bot/	Routes Telegram messages by type (voice, photo, text, forwarded)	Nothing — message routing is universal	Entire module reused as-is
agent/	LLM tool-calling loop, persona onboarding, conversation memory, Instinct layer	System prompt, onboarding questions, Instinct prompt	Agent loop, memory management, tool dispatcher
agent/tools.py	Tool schemas passed to GLM + dispatcher for tool execution	Tool names and parameters for the new domain	Dispatcher architecture, error handling, tool loop
scheduler/	5 proactive jobs: morning brief, spoilage, velocity, credit, digest	Alert thresholds and domain-specific logic per job	APScheduler infrastructure, job runner, message dispatch
db/	Supabase schema, SQLAlchemy models, all query functions	Table schemas and column names for new domain entities	Connection management, migration tooling, query patterns

9.2 Domains This Architecture Addresses

Any business with inventory, supplier relationships, buyer credit, and a need for market intelligence can run on this skeleton. The customisation required is a new system prompt, new tool schemas, and new database tables — estimated at 2-4 weeks of engineering per domain:

Domain	Inventory Entity	Credit / Buyer Entity	Price Benchmark
Fresh Produce Wholesale (current)	Tomato, cili, bayam (kg)	Retail buyers, pasar malam vendors	FAMA weekly benchmark
Fisheries Wholesale	Fish, prawns, squid (kg/box)	Fish mongers, hotel buyers	FAMA seafood benchmark
Construction Materials	Cement, steel bar, sand (ton/unit)	Contractor advances, project credit	CIDB material price index
Livestock Trading	Cattle, poultry, goats (head/kg)	Abattoir buyers, restaurant chains	DVS / FAMA livestock benchmark
SME Pharmacy Distribution	Medicines, medical supplies (units)	Clinic accounts, GP credit lines	Pharma wholesaler price lists

The long-term vision is a network of domain-specific agents, each generating trade data in their vertical, feeding into a shared financial infrastructure layer. Each new deployment strengthens the banking relationship, increases the intelligence sold to brand subscribers, and adds a new sector to the platform data moat.

10. Financial Projections

10.1 Revenue Stream Assumptions & Justification

Stream 1 — Market Intelligence Subscriptions

Pricing: RM 2,500/month per brand subscriber.

Justification: Malaysia B2B market intelligence services (e.g., MailerTrack, Intrack) charge RM 1,500-5,000/month for FMCG price monitoring. Stocky's real-time pasar borong demand data is more granular and primary — priced at the lower-mid range to drive early adoption.

Growth: 10 subscribers (Month 12) → 25 (Month 24) → 50 (Month 36). Conservative: 10 subscribers = 3.3% of the ~300 active FMCG distributors operating through Malaysian wholesale channels.

Stream 2 — Embedded Finance Referral Fees

Structure: Stocky refers pre-screened traders to banks like Agrobank. The bank disburses working capital loans. Stocky earns a 1.5% referral fee on loan value.

Justification: Standard fintech referral fees in Malaysia range 1-2% of disbursed value. Banking micro credit products range RM 3,000-50,000; we use RM 10,000 as conservative average [8].

Borong benchmark: Agrobank channelled RM 300M through Borong's platform [13]. At 150,000 businesses, that is RM 2,000 per business. Stocky targets 500 traders in Year 1, 10% take-up = 50 loans. Year 2: 1,500 traders, 15% take-up = 225 loans.

10.2 Three-Year Revenue Projection

Revenue Line	Year 1 (RM)	Year 2 (RM)	Year 3 (RM)	Basis
Stream 1: Market Intelligence (avg subs x price x 12)	300,000	750,000	1,500,000	10→25→50 subs @ RM2,500/mo
Stream 2: Finance Referral Fees (loans x RM10K x 1.5%)	7,500	33,750	675,000	50→225→4, 500 loans
Government / FAMA Data Partnership	—	500,000	1,000,000	MDEC / FAMA pilot Year 2+
Regional Expansion (Penang, JB, Kuching)	—	—	4,500,000	3x KV revenue at 3,000 traders
TOTAL REVENUE	**RM 307,500**	**RM 1,283,750**	**RM 7,675,000**	

10.3 Cost Structure

Cost Item	Year 1 (RM)	Year 2 (RM)	Year 3 (RM)	Note
Developer salaries (2 engineers + 1 PM)	180,000	240,000	360,000	RM 5,000-8,000/month each
Z.AI GLM API tokens	73,000	292,000	657,000	RM 0.08/conv × 10/day × avg traders × 365
Cloud hosting (Railway + Supabase)	2,400	4,800	10,000	RM200/month, scales with usage
Field onboarding agents (pasar borong visits)	24,000	36,000	60,000	RM 2,000/month x 2 agents x 6 months
TOTAL COST	**~279,400**	**~572,800**	**~1,087,000**	

10.4 Path to Profitability

At RM 216,000 annual cost and RM 307,500 conservative Year 1 revenue, Stocky AI is cashflow positive from Month 9, when the first 10 data subscribers are onboarded. This is achievable without external funding — though a Cradle or MDEC seed grant of RM 150,000-300,000 would accelerate field onboarding and regional expansion.

Sources & Footnotes

All numbers in this proposal are derived from publicly available sources or calculated transparently from benchmarks. Where estimates are used, the methodology is stated explicitly.
